ABSTRACT:

CHG DATE=19990905 STATUS=O>A method of organizing information in which the search activity of a user is monitored and such activity is used to organize articles in a subsequent search by the same or another user who enters a similar search query. The invention operates by assigning scores to articles under the key terms in the index. As users enter search queries and select articles, the scores are altered. The scores are then used in subsequent searches to organize the articles that match a search query. As millions of people use the Internet, type in millions of search queries, and display or select from the many articles available over the Internet, they rank the information available over the Internet through an evolutionary process. The invention includes additional embodiments which incorporate category key terms and rating key terms.

TDB-ACC-NO: NN9801271

DISCLOSURE TITLE: Agent System for Gathering, Integrating, Relevance Ranking and Presenting Digital Text Documents from Heterogeneous Information Sources

PUBLICATION-DATA:

IBM Technical Disclosure Bulletin, January 1998, US

VOLUME NUMBER: 41

ISSUE NUMBER: 1

PAGE NUMBER: 271 - 272

PUBLICATION-DATE: January 1, 1998 (19980101)

CROSS REFERENCE: 0018-8689-41-1-271

DISCLOSURE TEXT:

This document contains drawings, formulas, and/or symbols that will not appear on line. Request hardcopy from ITIRC for complete article. Disclosed is an agent system that allows multiple heterogeneous information sources of digital text documents to be searched in response to a user's query. A user enters a single query into the agent system. The agent system submits that query against the different information sources and creates a temporary database containing all the documents from all the information sources that satisfy the query. The documents in the temporary database are ranked according to how relevant they are to the user's query and are presented to the user in a single ordered list. The user interface to the agent system is via a web browser. To use the system, a user enters a query (#1 in the Figure). A query consists of two separate pieces of data: a list of keywords and a free-format text description of the type of information that the user will like to see.

SECURITY: Use, copying and distribution of this data is subject to the restrictions in the Agreement For IBM TDB Database and Related Computer Databases. ABSTRACTED-PUB-NO: US 5933822A

BASIC-ABSTRACT:

NOVELTY - The apparatus employs natural language processing to improve the accuracy of a keyword based document search performed by, for example, a statistical web search engine (20), by the production, comparison and weighting of matching logical forms associated with a search query and each of the retrieved documents (35).

DETAILED DESCRIPTION - Apparatus includes a processor and a memory with stored executable instructions, which instructs the processor. It produces in response to a query a logical form portraying semantic relationships between words associated with the query. A corresponding second logical form for each different document in the output document set is obtained, this form portrays the semantic relationships between words associated with a phrase in the document.

USE - For providing apparatus and accompanying methods for an information retrieval system utilising natural language processing to process results retrieved by, for example, an information retrieval engine such as a conventional statistical based search engine, in order to improve overall precision. DESCRIPTION OF DRAWING(S) - The drawing shows depicts a very high level block diagram of an information retrieval system 5. (20) retrieval engine; (35) retrieved documents.

ABSTRACTED-PUB-NO: WO 9905618A

ABSTRACTED-PUB-NO: US 6070176A  
BASIC-ABSTRACT:

The method involves receiving a ranking of several sets of data. The sets of data are distributed among several computers on a network. The ranking is based on a set of criteria. A map of the sets of data is generated. The map visually indicates the ranking. The set of criteria corresponds to a set of user-provided criteria and the ranking is based on a degree of relevance of each data set to the set of user-provided criteria.

The network is a wide area network, so that the data sets are distributed over the wide area network. The map includes several objects which are displayed on the display device. Each of the objects represents one of the data sets. The ranking is indicated in the map, at least in part, by at least one attribute of a given object from the list consisting of: a colour, a size, a shape or a texture of the given object.

ADVANTAGE - Provides intuitive way of graphically illustrating portion of world wide web. Shows relevance of web pages to users search criteria.

ABSTRACTED-PUB-NO: WO 9836343A  
EQUIVALENT-ABSTRACTS:

The method involves receiving a ranking of several sets of data. The sets of data are distributed among several computers on a network. The ranking is based on a set of criteria. A map of the sets of data is generated. The map visually indicates the ranking. The set of criteria corresponds to a set of user-provided criteria and the ranking is based on a degree of relevance of each data set to the set of user-provided criteria.

The network is a wide area network, so that the data sets are distributed over the wide area network. The map includes several objects which are displayed on the display device. Each of the objects represents one of the data sets. The ranking is indicated in the map, at least in part, by at least one attribute of a given object from the list consisting of: a colour, a size, a shape or a texture of the given object.

ADVANTAGE - Provides intuitive way of graphically illustrating portion of world wide web. Shows relevance of web pages to users search criteria.

ABSTRACTED-PUB-NO: JP 10198613A

BASIC-ABSTRACT:

The method begins by generating several ranked account candidates through an application reception server for an on-line proposer in a public e-mail service. An unused account from the generated account candidates is then searched sequentially from the first rank.

When a usable e-mail address is determined, the use of the other e-mail addresses is prevented and the determined e-mail address is reserved as a recommendation address. The reservation of the other account candidates is released upon determination of usable e-mail address.

ADVANTAGE - Ensures easy acquisition of desired e-mail address. Unused account can be shown, avoiding high server operation. Increases correspondence of service for user.

ABSTRACTED-PUB-NO: US 5920859A

BASIC-ABSTRACT:

The method involves obtaining a list of hyperlinks pointing to each document, while each hyperlink includes one or more terms. Each document is indexed with the terms in the hyperlinks pointing to that document. A number of hyperlinks, each

containing a particular term, may point to a document. The number of hyperlinks containing the particular term pointing to the document is indexed with that document.

A particular term may appear in hyperlinks pointing to a number of documents, while the number of documents has the particular term in hyperlinks pointing to those documents and is indexed with that term.

USE - For retrieval of hypertext document, e.g. for searching data bases distributed over wide area network such as world wide web.

ADVANTAGE - Allows ranking documents based on document relevance to query, where latter has at least one term, and where hyperlink contain terms and point to corresponding document.
